

Abstract

A system and method for transforming XML items is provided. The system includes a transformer that can selectively input XML items in a first format and
5 selectively transform the input XML items to one or more transformed XML items in one or more second formats. The system also include an output manager that can be employed to facilitate selectively pulling and/or pushing a subset of the transformed XML items from the transformer to a variety of output destinations. The system provides
10 an input abstractor that exposes data stored in data stores that implement the input abstractor as a data model and info set, which facilitates navigating such exposed data.
